Applicants' Response filed August 30, 2005 to a Restriction Requirement is acknowledged. Applicants elected without traverse Group I, claims 1-19, directed to increasing the oral bioavailability and increasing the extent of absorption of an oral dosage of glycopyrrolate. Claims 20-27, Group II, have been canceled.

Applicants are requested to send a complete list of all co-pending and related applications when responding to this Office Action.

An Information Disclosure Statement filed March 25, 2004 is further acknowledged and has been reviewed.

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 1-14 are rejected under 35 U.S.C. 103(a) as being unpatentable over Venkataraman, B., WO 01/08681, in view of Evans, A. M., Therapeutic Drug Monitoring.

Venkataraman teaches oral administration of glycopyrrolate at dosage between 1mg to 10 mg wherein an increase in bioavailability and the extent of absorption are sought. See page 18, lines 12-16, where dosage ranges are disclosed. Venkataraman teaches various means of increasing bioavailability and the extent of absorption of glycopyrrolate following oral administration through the incorporation of a permeation enhancer in a pharmaceutical composition comprising glycopyrrolate, through compositions comprising micospheres of artificial polymers or proteins, through buccal or sublingual modes of administration, through slow- or control-release formulations,

optionally using enteric coatings, through local delivery or oral adhesives and through targeting delivery systems. See the discussions on pages 18-23. A preferred tablet formulation for oral administration is disclosed on pages 24-25. Venkataraman fails to specify the limitation without food. However, such a dosing requirement is one that would always be considered by those skilled in the art. Evans teaches components of food alter drug absorption through alterations in drug solubility. Further, the nutritional status of a patient can also contribute to variability in drug absorption and bioavailability. The determination of an optimal dosing regimen is well within the purview of those skilled in the art through no more than routine experimentation.

Claims 15-19 appear to be free of the prior art.
